

Hemorrhoid Treatment Using Infrared Photocoagulation (Coagulation Therapy)

Piles are very uncomfortable and often painful. Fortunately, there are a lot of remedies available right now - ranging from home remedies to over-the-counter drugs in order to surgical procedures. Mild cases subside on their own as long as the cause is eliminated. Home remedies as well as creams help speed up the process of recovery a bit. For more severe cases, surgical procedure offer the fastest way to get rid of piles. For mild to moderate cases, photocoagulation for **hemorrhoids** is really a non-surgical medical procedure that gives effective and also fast therapy.

Photocoagulation for **hemorrhoids** uses high-intensity infrared light to get rid of hemorrhoids and it is also known as infrared coagulation. The patient lies on his side with knees drawn towards the upper body as well as the doctor inserts a proctoscope within the anal canal. The hemorrhoid is grasped and an intense beam of infrared light will be directed to be able to its base. The light forms scar tissue that forms a clot. This clot blocks blood flow and suffocates the hemorrhoid till it dies and also falls out. The scar cells also hold together the affected veins and prevent them from bulging out of the anus.

This Treatment Option Presents Permanent and Fast Relief to Most Patients

People who have undergone infrared coagulation have rarely had to come back for additional treatments. Those who have suffered from piles but have not found home remedies successful find relief with this option. Results tend to be fast and symptoms go away quickly. It is also safe to perform on elderly or sickly patients, which is not always the case for some other medical procedures.

However, this Option is Painful and Costly

It's expensive but it is a bit cheaper compared to surgery. The actual process is painful and you might experience soreness after, especially when it comes to urinating and defecating. You may also experience bleeding from the anus after undergoing this treatment. Infrared coagulation works well but bear in mind that piles may develop again. It is also important to note that this treatment is recommended for small piles and only one hemorrhoid is treated at a time. An period of 10-14 days in between procedures is advised.

You are Considering this Treatment Option, Ask Your Doctor about It First

Depending on your case, there may be other options that you should consider before choosing to undergo this procedure. The doctor's expertise in performing this is also important and success of the whole process depends mainly on this. Serious infection may occur from the procedure so take the time to look for a qualified doctor with proper equipment.

Aspirin Ingestion is Also Frustrated 5 Days Before and After Infrared Coagulation

Hemorrhaging occurs up to 10 days after the procedure and you need to take some time off work for this. Your stool should be softened to avoid further discomfort. To do this, increase your fiber intake or even make use of other stool softeners. To relieve pain, taking sitz baths can help. Your doctor may also prescribe you with pain relievers if necessary.

HemorrhoidsPilesHemorrhoid

- Just like with any remedy, photocoagulation for hemorrhoids come with risks.
- It is important for you to weigh the pros and cons before undergoing any process.
- Depending on the case of your piles, infrared coagulation might prove to be the best option for you.
